

Fuel Polishing

INCREASE PERFORMANCE, SAFETY AND RELIABILITY

OVERVIEW

Most people who operate and maintain generator sets with diesel engine systems are familiar with the black slimy material frequently seen in their fuel filter elements and sometimes found in the bottom of their fuel tanks.

It is known by many names: sludge, mud, dirt, and many other unsavory terms. Fuel is naturally unstable. Its quality and chemistry are continuously degraded by transportation and storage from refinery to user, oxidation, heat and pressure of engines, pumps and injectors, and by water and microbial contamination. Degraded fuel quality is usually noticed when the color and clarity of fuel has shifted from a clear bright to a dark brown/black. As these changes in particulates increase in size and mass, eventually, you will notice sludge forming on the filters, in the tank and other fuel system components.

BENEFITS OF FUEL POLISHING

Professional Fuel Polishing will reverse the degradation process and restore and stabilize the overall quality of your fuel.

- More power, less smoke and soot
- Clean injectors, filters and storage tanks which extend the life of the injection system and the engine
- Stabilized fuel
- Reduced fuel consumption
- Increased performance, safety and reliability of your generator set

WHEN SHOULD FUEL POLISHING BE PERFORMED?

Most major manufacturers recommend Fuel Polishing be performed every 2 years.

Call us today at 770-381-2424 to add this valuable service to your preventative maintenance plan!
